

Installation Guide

BH3 nodes and its **Set BT Variable / Get BT Variable** units only appear once Visual Scripting has built its node library. One menu item does all of it:

Tools → BH3 → Install

Mac, Linux - Unity 6.4 (6000.4.3f1) <DX12>

It initialises Visual Scripting if the project has never used it, adds BH3's assemblies and types to the node library and type options (keeping whatever the project already had), regenerates the nodes, and generates the custom inspector properties. A dialog lists what it did. Running it again is harmless.

The same thing by hand, if you prefer to see each step:

- Edit → Project Settings → Visual Scripting
- Click Initialize Visual Scripting (only offered on a project that has never used it)
- Under Node Library, add ArcaneOnyx.BehaviorTree and ArcaneOnyx.GraphCore; under Type Options, add GuardTrigger
- Under Node Library, click Regenerate Nodes and wait
- Under Custom Inspector Properties, click Generate and wait

Run Install again whenever a custom Visual Scripting unit does not show up in a script graph's finder. Behavior tree nodes are different: a C# node appears in the canvas right-click menu as soon as it compiles.
